
TO : Surgeon Pasadena Area Station Hospital

1. The incidence of nasopharyngial infection has remained about the same but quite a few have developed either otitis media or otitis externa as a complication.

2. Weekly physical inspections were made by company commanders with the assistance of the Dispensary Surgeon.

3. General cleanliness of the post was good. Irregular, but frequent, inspections were made of grounds, buildings, mess hall, latrines, locker rooms and pool.

4. Tinea Trichophytosis still continues to be a major problem principally because of the number of men infected on arrival. Very few new cases have developed after arrival.

5. We had two outbreaks of enterocolitis, one on July 2nd and the other on July 23rd. The cause for neither was definitely determined in spite of help from the local Health Dept., Water Dept. and Building Inspectors. The first outbreak involved 259 men out of 838 men present although only 67 turned out for sick call. The second was of about the same proportion, 242 out of 782 men with 122 turning out for sick call for that reason alone. These figures of the number on sick call are not totals for the day but are the number who had diarrhea.

F. G. HARGRAVE Jr. M.C.
Contract Surgeon
