Dear John:

I have received a copy of Doctor Hammon's corrections on the manuscript of the Neutralization Test. One or two inconsequential errors are found in the text:

Page III. Item 1, last line. Insert minus before 76° C.

Page IV, Second Paragraph. Omit "apparently in shipment" as confusing, or change sentence.

Page VI, last line. Ten instead of Fifty.

Page XI, third from last line. Omit apostrophe in "it's".

The complement-fixation part of the manuscript is already in your hands, or Doctor Hammon may have sent it with his report. It is corrected to date by Doctor Casals.

It appears to me that Doctor Hammon's report may be too complicated for the ordinary laboratory which intends to apply the test in a routine way for diagnosis.

With best wishes,

Yours sincerely,

[Signature]
