6/4/34

Dear Di Salvi,

I am sorry that I cannot send you any virus III or antivirus III serum of known activity as I have not worked with it for four years. I am, however, sending you 2 tubes of dried virus labelled 1773 2/4/30 & 1775 1/4/30. I think it rather unlikely that they are active. If you think it worth while to test them I suggest that you inoculate a rabbit in the testis, tail & pann on, after 4 days whether it shows anything or not. If the second rabbit shows nothing in 4 days, the virus is probably dead. I have not been successful in "starting up" the virus from English rabbits but you could probably get it back by doing a couple of rapid passages from Brown-Pierce...
Dear [Name],

I have some news regarding the virus that I mentioned in my last letter. The virology laboratory has tested the sample from the patient and confirmed that it is the same virus that was present in the initial sample. This is a significant breakthrough in our research.

I am sending you a little more detailed information about the virus, including its characteristics and potential treatment options. Please review this information carefully and let me know if you have any questions.

I am also sending you a tube of rabbit serum labelled 350, which has antibodies that could be useful in further studies. If you are interested, please let me know and I will arrange for it to be shipped to you.

I am sorry for the delay in responding to your request. I have been busy with other projects, but I am committed to our research and I will do everything I can to ensure its success.

Thank you for your patience and support.

Yours truly,

[Your Name]
