Dear Doctor Sabin,

I am very grateful to you for your kind letter and for your kindness in offering to send me some of your original type 2 rabbit serum that you used for microprecipitin test and also comparable rabbit sera for type 1 and type 3.

I should be grateful if you would send me these immunsera. It will be particularly useful to us for the study about microprecipitin test we have undertaken with your method.

Dr. Eggers wrote me that no microprecipitin antigen is available. He proposed to send me some of one immunsera but I have not received this immunsera and I do not know when Dr. Eggers can send me it.

If your immunsera is lyophilised, would you be kind enough to let me know the quantity of distilled water to be added to reconstitute the sera.

I thank you very much for your letter on the 16th of May, containing a copy of the program that you drew up at the request of the Ministry of Health in Mexico. It is highly desirable to precise the conditions which it is necessary to fulfill in order to compare studies in different parts of the world, bearing in mind of social and economic conditions.

Your research programme in connection with poliomyelitic eradication campaign in Mexico will be most useful to me.

I have safely received the reprint of the Royal Society of Health.

With many thanks,

Yours sincerely,

Professeur R. Sohier.
