Dear Dr. Sabin,

Thank you very much for the copy. I think it is really a bible for people working with attenuated strains of poliomyelitis virus and it will be of much help for us when we are going to publish the next paper. I am glad to find that our way of inoculating the monkeys intracerebrally is exactly what you find to be the most accurate one.

The investigation we are carrying out now is similar to that done by Horstmann et al in 1957 but we have not vaccinated the children with inactivated virus before feeding them with the L Sc-Sabin strain.

We gave the virus to only 2 of 37 children and found a rapid dissemination to practically all of them. As far as we have seen now there is some increase in the neurotropism of the virus excreted by some of the children. Unfortunately we cannot keep so many monkeys here at the same time and they are expensive. It takes us therefore fairly long time before we have gone through the whole population of virus excretors.

I will be glad to send you the manuscript when we have prepared it.

With kind regards

Yours sincerely

Tore Wesslén M.D.
