September 17, 1937.

Dear Doctor Wolf:

Doctor Olitsky and I have read with great interest your paper on Granulomatous Encephalitis in Man. We are particularly interested in this case in view of the fact that for the past two years we have been engaged in a study of Toxoplasma. We are fully aware that the differentiation between so-called Encephalitozoa and Toxoplasma on purely morphological grounds is a very difficult task. An examination of your photographs, however, and a comparison with some of our own experimental material suggests to us very strongly the possibility of Toxoplasma in your case.

Under separate cover we are sending you a reprint of a brief note we have written on the subject and we would greatly appreciate having a copy of your very complete report and excellent review when reprints are available.

Very sincerely yours,

Albert B. Sabin.
