November 10, 1937

Dear Doctor Salton:

Thank you for your notes regarding the Trypanosoma clarea. We shall be glad to follow your suggestions concerning the explanatory footnote. I hope to be able to complete the paper soon after the first of the year—right now a mass of rather negative polio results has me somewhat hindered.

If it won't entail too much trouble for you, I should like very much to try adhesion tests to infected mouse kidneys. Such tests should constitute direct proof of the dissimilarity of the monkey and infecting mono types of antibodies, and would fulfill the conditions of the probable indication of the nature of the monkey response (i.e., whether it is a mother-natura):

Kindly convey my regards to Dr. Olszewski and my thanks for his recent letter.

Sincerely,

[Signature]
