Dear Dr. Sabin:

I was glad to learn that the slides I sent had reached you safely. I shall be glad to replace the single one of \textit{P. circumflexum} which arrived broken, if you will let me know which one it was.

It seems to me that the case of \textit{Toxoplasmosic} encephalitis which you mentioned is of a great deal of interest, for it suggests that such infection may be in fact not very uncommon in man. It also makes the problem of the mode of transfer one of much importance.

After examining your slides and studying the course of a good many cases of what we have regarded as \textit{Toxoplasma} in sparrows we have begun to wonder whether the two both belong to the same genus. I am quite sure that what we have called \textit{Toxoplasma} is the same as what a number of others have similarly identified, but it does seem a good deal different from your parasite. And yet there seems no other place
to put it. It is probable that it is not different from what Aragao and some others have called hemogregarines, but it is also quite certain (in my own mind at least) that they were wrong. I shall be interested to know what your opinion is after you have had time to go over the slides.

Very sincerely yours,

Reginald D. Manwell
