Dr. Albert B. Sabin
The Children's Hospital Research Foundation
Elland Avenue and Bethesda
Cincinnati, Ohio

Dear Albert:

I wonder whether I can impose on your good will again by asking for a sample of Brunhilde poliomyelitis virus, either as a glycerolated segment of tissue or a frozen suspension, whichever is easier for you to handle.

We plan to inject one or two rhesus monkeys intracerebrally in order to have a fairly large quantity of infected tissue suspension. As I am not too familiar with the handling of this virus, I would appreciate your advice on how much to inject, dilution and quantity; and when to expect the animals to come down. Also, whether to harvest only the cervical and lumbar enlargements rather than the entire cord and brain stem.

With thanks for your patience, and with best wishes,

Sincerely yours,

J. Casals, M. D.
