Dear Dr. Sabin,

I received your letter of June 18, from which I learned that you were able to find no intranuclear inclusions in the slide of the liver biopsy I had sent to you (I don't need it returned to me). What we have interpreted as nuclear inclusions are the aspects of nuclei with margi~ated chromatin and amorphous central substance, as their appear in the microphoto annexed, and which remember the picture reported in the work of Zuelzer and Stulberg (Am.J.Dis.Child.83/421, 1952).

I thank you very much and remain, dear Dr. Sabin,

Sincerely Yours
