Dear Dr. Van Bogaert:

In reply to your letter of February 3rd in which you asked me whether I have anything to contribute to a special session on the biochemistry and biology of encephalitis, I would like to say that I have been thinking of asking you whether some work that I have been doing on the use of a fluorescence antibody technique in the study of viral encephalitis might be of interest to the symposium. I do not know whether this would fit into the section on biochemistry and biology or more specifically in the general program of neuropathology. My studies are still in progress and I am not ready to send an abstract at this time. However, if you should like to consider it for some place on the program the title would be: "Studies on Viral Encephalitis by the Fluorescent Antibody Technique" by Albert B. Sabin and Giacomo Messore.

With best wishes.

Sincerely yours,

Albert B. Sabin, M. D.
