MEMORANDUM

February 2, 1961

TO: Members, Viruses and Cancer Panel

FROM: Chief, Human Virology Section, Viruses & Cancer Program, NCI

SUBJECT: Resolution No. 11 Listed in Memorandum to the Panel Dated October 26, 1960.

The following resolution No. 11 is offered for your consideration. This resolution was inadvertently left out of a list of 12 resolutions which were recommended by the Viruses and Cancer Panel at its September meeting.

On October 26, 1960, Dr. Scudder sent a memorandum to the Panel which to quote was as follows:

"In reviewing the meeting notes with my secretary, I find I am at a loss to account for any action on the following proposed resolution which deals with reagent development as well as production. Under this proposal we would seek to supplement the number of viral reagents to be developed and thereby to give the broadest possible diagnostic range for identification of human agents. The proposal is significant, and distinct from the one passed which would relate only to large quantity production of reagents for which satisfactory production protocols are available."

Resolution No. 11 is as follows:

Arrange for the development and production of typing reagents for those human viruses outside of the enterovirus, adenovirus, myxovirus, and arbovirus groups for which provision has not otherwise been made, in order to assure the availability of as complete a group of reagents as possible, for the diagnosis of viruses commonly found in man and of interest in virus-cancer research; contracts or grants to be used, if necessary.
