Last Wednesday was a special day for the communications media when Neil Armstrong, first man on the moon, gave his first press conference as professor of aerospace engineering at the University of Cincinnati.

In the course of conversation, Professor Armstrong said his main goal as a teacher is to provide his students with a basic education. He believes undergraduates should seek a solid, broad foundation in their education to best equip themselves for participation in a fast-changing world. Too many students, he said, base their career decisions on popular issues, but with things changing so quickly "you can't predict what the popular issue will be two years from now."

Armstrong's teaching career at the University of Cincinnati begins with Winter Quarter classes on January 3. He will conduct a course entitled "Applied Aircraft Performance" designed for first- and second-year engineering students. He is also developing a new course for the 1972-73 academic year on "Fundamentals of Flight Testing," geared to seniors and graduate students.

Armstrong previously taught at Purdue University where he earned a Bachelor of Science degree in aeronautical engineering (1955). He holds a master's degree received last year from the
