To ensure safe handling of this object and to prevent further damage, the lantern slide was sandwiched between two pieces of Vivak and secured together with a toned strip of filmoplast R along the edges. The edges of the lantern slide were previously covered with a strip of Mylar to avoid any contact between the object and the adhesive of filmoplast R. The Vivak was cut to the same dimensions as the lantern slide. The filmoplast R was toned with an acrylic paint. The Lantern slide was then housed in a four flap enclosure and placed in an envelope.
