To ensure safe handling and to prevent further damage, the lantern slide was sandwiched between two pieces of Vivak and secured together with a toned strip of Filmoplast R along the edges. The edges of the lantern slide were previously covered with a strip of Mylar to avoid any contact between the object and the adhesive of Filmoplast R. The Vivak was cut to the same dimensions as the lantern slide. The Filmoplast R was toned with an acrylic paint. The lantern slide was then housed in a four flap enclosure and placed in an envelope.
During Treatment: Placing a Mylar strap around the edges of the object to avoid any contact between the object and the adhesive of the Filmoplast R.

During Treatment: Placing the toned Filmoplast R strip to secure the sandwiched lantern slide.
