Albert B. Sabin, M.D.
Children's Hospital Research Foundation
Elland and Bethesda Avenues
Cincinnati, Ohio

Dear Albert:

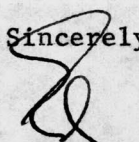

If I recall correctly, a few years ago at a meeting of the Commission on Virus Infections, you indicated that you'd had some success in localizing virus antigens in fixed tissues by indirect fluorescence microscopy.

One of the students in the Institute's Basic Science Course is interested in searching some of Dr. Manion's cases of unexplained pediatric deaths for enterovirus antigens, and could do a more extensive job if he could work with fixed tissues from the AFIP.

If you have specific tricks that might make such a study possible, I would appreciate learning them from you.

My best regards,

Sincerely,

EDWARD L. BUESCHER
Lt Col, MC
Chief, Department of Virus Diseases
